

Algebra

| | Algebra | | | | | |
|---|--|--|--|--|--|--|
| absolute value $ x-y $ | the distance between 2 points, x and y , on a number line | | | | | |
| absolute value $ x $ | $ x = \begin{cases} x, & \text{if } x \ge 0 \\ -x, & \text{if } x < 0 \end{cases}$ x expresses the distance from x to zero on the number line | | | | | |
| distance formula | $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$ = distance between 2 points (x ₁ , y ₁) and (x ₂ , y ₂) on coordinate plane | | | | | |
| midpoint formula | $M = \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right) = $ (average of the x coordinates, average the y coordinates) | | | | | |
| slope of a line between any 2 points (x ₁ , y ₁) and (x ₂ , y ₂) | $m = \frac{y_2 - y_1}{x_2 - x_1}$ slope is the measure of the steepness of a line horizontal line slope = 0; vertical line slope is undefined parallel lines have equal slopes; perpendicular lines - slopes are opposite (negative) reciprocals; product of slopes = -1 | | | | | |
| linear equation slope intercept form point-slope form standard form | y = mx + b, where $m =$ slope and $b = y$ coordinate of the y-intercept $y - y_1 = m (x - x_1)$ Ax + By = C | | | | | |
| equations for a circle | $x^2 + y^2 = r^2$ circle centered at (0, 0) with radius r | | | | | |
| | $(x-h)^2 + (y-k)^2 = r^2$ circle centered at (h, k) with radius r | | | | | |
| <u>equations for parabola</u> $y = a(x-h)^2 + k$ parabola opens up or down; vertex at (h,k) | | | | | | |
| | $x = a(y-k)^2 + h$ parabola opens left or right; vertex at (h,k) | | | | | |
| factoring difference of 2 squares sum of 2 squares difference of 2 cubes sum of 2 cubes perfect square trinomials | $\begin{array}{c} a^{2}-b^{2}=(a+b)(a-b) \\ prime (not factorable) \\ a^{3}-b^{3}=(a-b)(a^{2}+ab+b^{2}) \\ a^{3}+b^{3}=(a+b)(a^{2}-ab+b^{2}) \\ (a+b)^{2}=a^{2}+2ab+b^{2} \\ \end{array}$ $\begin{array}{c} 1 \\ 1 \\ 1 \\ 2 \\ 1 \\ 1 \\ 3 \\ 3 \\ 1 \\ 1 \\ 5 \\ 10 \\ 10 \\ 5 \\ 1 \end{array}$ | | | | | |
| quadratic formula | $(a + b)^{2} = a^{2} + 2ab + b^{2} \text{ and } (a - b)^{2} = a^{2} - 2ab + b^{2} \qquad \qquad$ | | | | | |
| discriminant test | $b^2 - 4ac = 0$ → one real solution $b^2 - 4ac > 0$ → two real solutions $b^2 - 4ac < 0$ → two complex conjugate solutions | | | | | |
| exponent rules | $x^{0}=1$ $(x^{a})^{b}=x^{ab}$ $x^{a}x^{b}=x^{a+b}$ $\frac{x^{a}}{x^{b}}=x^{a-b}$ $x^{-a}=\frac{1}{x^{a}}$ and $\frac{1}{x^{-a}}=x^{a}$ | | | | | |
| radicals and exponents | $\sqrt{x} = x^{1/2}$ $\sqrt[3]{x} = x^{1/3}$ $\sqrt[b]{x^a} = x^{a/b}$ | | | | | |
| complex number | $i=\sqrt{-1}$ $i^2=-1$ $i^3=-i$ $i^4=1$ | | | | | |
| absolute value equation | If algebraic expression = A, then set up two equations and solve: algebraic expression = A and algebraic expression = -A | | | | | |
| absolute value inequalities | If algebraic expression < A, then set up compound inequality (conjunction) and solve: | | | | | |

Algebra

| distance | d = rt distance = rate x time | | | | |
|---|---|--|--|--|--|
| average (mean) | | | | | |
| uveruge (meun) | $average = \frac{x_1 + x_2 + x_3 + \dots + x_n}{x_n}$ | | | | |
| % change | $percent change = \frac{n}{\frac{change in quantity}{original quantity}}$ | | | | |
| / | $percent change = \frac{change in quantity}{change in quantity}$ | | | | |
| | original quantity | | | | |
| proportion | a - c implies $ad - ba$ by more multiplication | | | | |
| | $\frac{a}{b} = \frac{c}{d}$ implies $ad = bc$ by cross-multiplication | | | | |
| direct variation | | | | | |
| | $y = kx$ or $\frac{x_1}{x_1} = \frac{x_2}{x_2}$ where k is the constant of variation | | | | |
| | y_1 y_2 | | | | |
| inverse variation | $y_1 y_2$ $xy = k or x_1y_1 = x_2y_2 \text{ where } k \text{ is the constant of variation}$ | | | | |
| arithmetic sequence | $a_n = a_1 + (n-1)d$, nth term of arithmetic sequence, d is the common difference between terms | | | | |
| arithmetic series | $a_n = a_1 + (n-1)d$, nth term of arithmetic sequence, d is the common difference between terms $S_n = \frac{n(a_1 + a_n)}{2}$, $S_n = \text{sum of first "n" terms of a finite geometric series; a_1 = \text{first term}$ | | | | |
| geometric sequence | $a_n = a_1 r^{n-1}$ nth term of the geometric series; r is the common ratio | | | | |
| geometric series | | | | | |
| | $S_n = a_1 + a_1 r + + a_1 r^{n-1} = \frac{a_1(1-r^n)}{1-r}$, $S_n = \text{sum of first "n" terms of geometric series}$ | | | | |
| probability | $\frac{1-r}{1-r}$ Probability of an outcome happening = number of desired outcomes | | | | |
| producting | total number of possible outcomes | | | | |
| | Probability of two mutually exclusive events, A and B, happening = $P(A) \bullet P(B)$ | | | | |
| combinations | A combination means the order of the elements doesn't matter. For example, a shirt and pants is the same thing as pants and a shirt. Possible combinations of 3 shirts and 4 pants = $3 \times 4 = 12$. | | | | |
| | TUTOPING | | | | |
| | pants and a sint. Possible combinations of <i>P</i> sints and 4 pants – 5 x 4 – 12. ${}_{n}C_{r} = \frac{n!}{r!(n-r)!}$ number of combinations of <i>n</i> items taken <i>r</i> at a time; order does not matter; ${}_{n}P_{r} = \frac{n!}{(n-r)!}$ number of ways to arrange <i>n</i> items taken <i>r</i> at a time; order does matter; | | | | |
| | r!(n-r)! | | | | |
| permutations | $P = \frac{n!}{n!}$ number of ways to arrange <i>n</i> items taken <i>r</i> at a time; order does matter; | | | | |
| | (n-r)! | | | | |
| logarithms | $\log_b y = x$ means $y = b^x$ | | | | |
| | $\log_h MN = \log_h M + \log_h N$ | | | | |
| | | | | | |
| | $\log_b \left(\frac{M}{N} \right) = \log_b M - \log_b N$ | | | | |
| | $\log_b M^N = N \log_b M$ | | | | |
| | $\log_b M = \frac{\log_c M}{1 + 1}$ (change of base formula) | | | | |
| | $\log_b M = \frac{1}{\log_c b}$ (change of base formula) | | | | |
| Transformations | | | | | |
| Translation (no rotation or | $(x, y) \rightarrow (x + a, y + b)$ represents horizontal shift of "a" units, vertical shift of "b" units); | | | | |
| size change) Reflection (flip) | | | | | |
| Over x-axis | $(x, y) \rightarrow (x, -y)$ | | | | |
| Over y-axis | $(\mathbf{x}, \mathbf{y}) \rightarrow (-\mathbf{x}, \mathbf{y})$ | | | | |
| Over line $y = x$ | $(\mathbf{x}, \mathbf{y}) \rightarrow (\mathbf{y}, \mathbf{x})$ | | | | |
| Over origin (line $y=-x$) | $(\mathbf{x},\mathbf{y}) \to (-\mathbf{y},-\mathbf{x})$ | | | | |
| <u>Rotation about origin</u> 90° CCW or 270° CW | $(\mathbf{x},\mathbf{y}) \rightarrow (-\mathbf{y},\mathbf{x})$ | | | | |
| 180° CCW of 270° CW | $ \begin{array}{c} (\mathbf{x}, \mathbf{y}) \rightarrow (-\mathbf{y}, \mathbf{x}) \\ (\mathbf{x}, \mathbf{y}) \rightarrow (-\mathbf{x}, -\mathbf{y}) \end{array} $ | | | | |
| 270° CCW or 90° CW | $(x, y) \to (y, -x)$ | | | | |

Geometry

| Perimeter | <u>In general, perimeter = sum of lengths of sides</u> | | | | |
|---------------------------|--|--|--|--|--|
| square | P = 4s | | | | |
| rectangle | P = 2L + 2W | | | | |
| circle | $C = 2\pi r$ (circumference) | | | | |
| Area | Note that the units are square units. | | | | |
| square | $A = s^2$ | | | | |
| rectangle, parallelogram | A = bh (note base and height are <i>always</i> perpendicular) | | | | |
| triangle | $A = \frac{1}{2} bh$ | | | | |
| kite | $A = \frac{1}{2} (d_1 d_2)$ where d_1 and d_2 are lengths of the diagonals | | | | |
| circle | $A = \pi r^2$ | | | | |
| trapezoid | $A = \frac{1}{2} (b_1 + b_2)h$ (average of bases times the height) | | | | |
| <u>Volume</u> | B = area of base; h = height | | | | |
| cube | $V = Bh = s^3$ where s is the side length | | | | |
| rectangular prism | V = Bh = lwh | | | | |
| sphere | $V = \frac{4}{3}\pi r^3$ | | | | |
| cone | $V = \frac{1}{3}\pi r^2 h$ | | | | |
| cylinder | $V = Bh = \pi r^2 h$ | | | | |
| Triangles | | | | | |
| Congruency Theorems | SSS, SAS, ASA, or AAS or use H-L (right triangles only) | | | | |
| Pythagorean Theorem | | | | | |
| Tythagoroan Theorem | $c^2 = a^2 + b^2$ is used to find length of sides or hypotenuse, c, for a right triangle | | | | |
| | If $c^2 = a^2 + b^2$, then the triangle is a right triangle (Converse of Pythagorean Theorem) | | | | |
| | | | | | |
| | If $c^2 < a^2 + b^2$, then the triangle is acute | | | | |
| | If $c^2 > a^2 + b^2$, then the triangle is obtuse | | | | |
| Common Pythagorean | 3-4-5 5-12-13 T O R 7-24-25 8-15-17 | | | | |
| Triples | $6 - 8 - 10 \qquad 10 - 24 - 26 \qquad 14 - 48 - 50 \qquad 16 - 30 - 34$ | | | | |
| 45-45-90 triangle | ratios of sides lengths: $1x : 1x : x\sqrt{2}$ | | | | |
| 30-60-90 triangle | ratios of sides lengths: $1x : x\sqrt{3} : 2x$ | | | | |
| | $x = \frac{60^{\circ}}{x\sqrt{3}}$ | | | | |
| Law of Sines and | For non -right triangles, use the Law of Sines to find side lengths and angles when possible, or use Law of Cosines | | | | |
| Law of Cosines | when you have 2 sides and the included angle. | | | | |
| (for non-right triangles) | $\frac{c}{b} = \frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c} \qquad c^2 = a^2 + b^2 - 2bc \cos C$ | | | | |
